

HIGH STRENGTH FOAM COLORS

The DR-Series dispersion was designed to give flexible polyurethane foams an economical replacement to Reactant dye, while still achieving an intense coloration in foam. By using a high strength pigment in conjunction with a high quality dispersing additive, and proprietary processing techniques, we were able to reduce the pigment particle size to maximize the pigment's tinting strength. The DR-Series is dispersed in proprietary universal vehicle that is totally compatible in flexible polyurethane foam and semi-flexible foams.
